

Laravel Internship Weekly Task

This assignment is designed to revise important PHP programming concepts inside Laravel. Interns are required to complete all tasks using Laravel Controllers and Blade templates. The objective is to strengthen logical thinking and prepare students for advanced Laravel development.

Topics Covered

- Conditional Statements
- Loops
- Functions
- Arrays
- String Handling
- Laravel Routing
- Controllers & Blade Templates

Main Project Task

Students must develop a **Student Result Management System** in Laravel. The system should display student information, calculate marks, generate grades, and produce formatted reports using Blade templates.

Project Requirements

Component	Requirement
Laravel Project	Create a new Laravel application
Controller	Create StudentController
Blade View	Create student-report.blade.php
Dummy Data	Use arrays inside controller
Logic	Use conditions, loops, functions
Output	Display report in HTML table

Task 1 — Conditional Statements

Students must use:

- if statements
- else statements
- elseif statements

Requirements:

1. Generate student grades based on percentage
2. Display Pass or Fail status
3. Show scholarship eligibility message
4. Check attendance below 75%

5. Determine whether number is even or odd

Task 2 — Loops

Students must practice:

- for loops
- foreach loops
- while loops

Requirements:

1. Display list of students dynamically
2. Print multiplication tables
3. Calculate total marks of all students
4. Loop through products array
5. Count total records

Task 3 — Functions

Students must create reusable functions for:

- Grade calculation
- Percentage calculation
- Attendance calculation
- Greeting messages
- Currency formatting

Exercise Questions:

1. Create function to calculate square
2. Create BMI calculator function
3. Generate username function
4. Create reusable helper functions

Task 4 — Arrays

Students must use:

- Indexed arrays
- Associative arrays
- Multidimensional arrays

Requirements:

1. Store student records in arrays
2. Find topper student
3. Search student by name
4. Sort students by marks
5. Count total students
6. Remove duplicate values

Task 5 — String Handling

Students must practice:

- strtoupper()
- strtolower()

- ucwords()
- strlen()
- substr()
- explode()• implode()

Requirements:

1. Format student names properly
2. Generate slugs from titles
3. Create usernames
4. Count characters in strings
5. Extract short descriptions

Final Dashboard Requirement

Students must combine all concepts and build a complete Student Result Dashboard. **Dashboard Features:**

- Student listing
- Grade calculation
- Attendance report
- Search functionality
- Blade table output
- Summary statistics

Submission Guidelines

Requirement	Mandatory
GitHub Repository	Yes
Laravel Project	Yes
Blade UI	Yes
Proper Code Comments	Yes
README File	Yes
Database	Yes

Important Instructions

- Write clean and properly formatted code
- Use proper variable names
- Separate logic inside controller
- Use Blade for frontend output
- Push code regularly to GitHub
- Follow Laravel coding standards

Internes are required to complete this assignment using their own logic and understanding; direct use of AI-generated solutions is strictly prohibited.
