

Laravel Login API with Postman

Build a secure **Login API** using Laravel and test it using **Postman**. The goal is to understand authentication flow, API development, and request testing.

1. Laravel Setup

- Create a new Laravel project
- Set up database connection (MySQL/PostgreSQL)
- Run migrations

2. User Authentication API

Create the following API:

POST /api/login

Request Body (JSON):

```
{  
  "email": "user@example.com",  
  "password": "password123"  
}
```

- Validate email and password
- Check user exists in database
- Verify password using Laravel Hash
- If credentials are correct:
 - Return success message
 - Return user data
 - Return authentication token (Sanctum or JWT)
- If credentials are incorrect:

- Return proper error message (401 Unauthorized)

Example Success Response

```
{
  "status": true,
  "message": "Login successful",
  "token": "1|xYzAbC123Token",
  "user": {
    "id": 1,
    "name": "Ali",
    "email": "ali@example.com"
  }
}
```

Create **User Registration (Sign Up)** and **Forgot Password APIs** using Laravel. Test all APIs using Postman.

POST /api/register

```
{
  "username": "ali123",
```

```
"full_name": "Ali Sher",  
"email": "ali@example.com",  
"password": "password123",  
"confirm_password": "password123",  
"gender": "male",  
"dob": "2000-01-01"  
}
```

Forgot Password API

POST /api/forgot-password

Request Body:

```
{  
  "email": "ali@example.com"  
}
```

Success Response:

```
{  
  "status": true,  
  "message": "Password reset link sent to your email"  
}
```
